# Defensive metrics: Cressey

What the defender gets, and what is and is not measured. Numbers come from the evaluation runs in the repo.

## Time saved for the analyst

**Not measured.** The repo has no baseline of analyst time. What is measured is machine time: time to stop a call, p50 617 ms with live Jev and the calls back to back (236 ms at the stage's pace, one run, 10-10); three fix guides in 9 to 14 s (10-10 demo path).

**Estimate (assumptions, not data):**

| Step per held incident | Without Cressey | With Cressey | Saved |
|---|---|---|---|
| Find what the agent did and why | 15 to 30 min | 2 to 5 min | 10 to 25 min |
| Find where the misused secret came from | 10 to 30 min | under 1 min | 10 to 30 min |
| Write a fix guide per owner | 30 to 60 min | about 5 min to review | 25 to 55 min |
| Decide the hold | 5 min | 2 min | about 3 min |
| **Total** | **about 1 to 2 h** | **about 10 to 15 min** | **about 50 to 100 min** |

The "without" column is a guess at a careful manual triage. Replace both columns with a timed test on the synthetic incidents. Not counted: false-alarm review time on real traffic, and approver time on writes held without a security reason.

## Precision of detections and conclusions

| Check | Result | Limit |
|---|---|---|
| Holds on normal sessions | **0/6** held by mistake | 6 synthetic sessions, written by the team |
| Incident sessions held | **8/8**, each at the call it names | the team wrote the incidents to match the rules |
| Write judgment at 0.5 | 30/30 on labelled writes (15 yes, 15 no) | labels are ours |
| Report check at 0.8 | **5/5** precision, 5/10 recall | 20 reports; misses listed in evaluation |
| Sourced guide steps | 100% citation validity | checks that a step cites a retrieved passage, not that the advice is good |
| Retrieval hit@3 after re-ranking | 30 to 31 of 31 | 33 team-written questions |

These are weak evidence on a set this small. They show the rules and triangle work on our own sessions, not a false-positive rate for real traffic. The held-out set from outside the team is not written.

## Coverage

| Framework | Covered | Coverage in the repo |
|---|---|---|
| **MITRE ATT&CK** | T1485, T1552.001, T1078 | Mapped in the pitch. The destructive-SQL and trap-key sessions exercise T1485 and T1552.001 |
| **MITRE ATLAS v5.6.0** | 8 techniques: AML.T0053, T0101, T0055, T0083, T0051, T0080, T0110, T0086 | IDs checked against the ATLAS reference file. The guide corpus holds 35 ATLAS mitigations |
| **OWASP Agentic** | ASI01, ASI02, ASI03 | **The OWASP corpus file is not in the repo** (download by hand), so no OWASP guide is checked against it |

Gaps: ATLAS and ATT&CK are hand mappings, and nothing tests them beyond the sessions named. Coverage holds only for traffic through Cressey.

## Summary

Measured: precision on the team's synthetic set (0 false holds, 8/8 incidents held) and machine speed. Not measured: analyst time saved. Coverage is a hand mapping, and the OWASP corpus is not loaded.
